

Penetration Testing as a Service

Penetration Testing as a Service (PTaaS)

Know your vulnerabilities before an attacker exploits them, and it's too late

Logi-Tech's Penetration Testing as a Service (PTaaS) delivers a structured, single-engagement penetration test using Pentera's automated platform - the same technology trusted by enterprise security teams globally.

You'll receive clear evidence of real, exploitable risks, ranked by business impact, along with an actionable remediation plan delivered by our local team.

Who is Penetration Testing (PTaaS) for?

- ✓ Organisations without an in-house security testing program
- ✓ Businesses facing cyber insurance reviews or compliance requirements
- ✓ Teams wanting to validate their current security investment before committing to further spend
- ✓ Organisations preparing for or responding to Essential Eight requirements
- ✓ Supply chain partners seeking to demonstrate security posture to clients or government

A structured engagement using Pentera's automated platform

PTaaS is a point-in-time penetration test available exclusively through Logi-Tech that gives you access to Pentera's automated attack platform - without the cost of an ongoing subscription to their continuous validation tool, and without the delays and expense of traditional manual penetration testers. One engagement. Enterprise-grade results.

Delivered by Logi-Tech specialists.

How the testing works

Pentera deploys a lightweight node within your environment and runs safe, real-world attack scenarios using techniques mapped to the MITRE ATT&CK framework. Testing runs in your live production environment; Pentera is engineered to operate without causing disruption or data loss. Every attack action is logged for audit purposes.

Black Box testing begins with no prior knowledge of your environment, replicating the position of an external attacker who has gained initial access.

Grey Box testing injects defined credentials (domain, local, service, cloud) to simulate a compromised insider or post-phishing scenario, revealing the downstream impact of an initial breach.

Why Pentera

Pentera is the global leader in automated security validation. Trusted by over 1,000 organisations worldwide, its platform executes real attack killchains in live production environments without causing disruption. Every test is aligned to MITRE ATT&CK and updated with the latest adversary techniques from Pentera Labs.

What we test

- ✓ Internal network (Black Box and Grey Box)
- ✓ External attack surface (internet-facing assets and services)
- ✓ Cloud environments and hybrid attack paths (Azure, AWS)
- ✓ Active Directory credential exposure and password resilience
- ✓ Ransomware readiness against real-world families (LockBit, BlackCat, Cl0p, and others)
- ✓ Privilege escalation and lateral movement paths

What you receive

- ✓ Executive summary with a Resilience Score and risk overview suitable for board and leadership reporting
- ✓ Technical report detailing every validated exploit, attack path, and compromised asset
- ✓ Prioritised remediation plan ranked by business impact, not theoretical CVSS scores
- ✓ Walkthrough session with Logi-Tech specialists to clarify findings and remediation steps
- ✓ Full audit trail of testing activity for compliance and insurance purposes
